1 Introduction

Given the opportunity to review the design document and related source code of the PolkaFantasy XP token contract, we outline in the report our systematic method to evaluate potential security issues in the smart contract implementation, expose possible semantic inconsistency between smart contract code and the documentation, and provide additional suggestions or recommendations for improvement. Our results show that the given version of the smart contract is compliant with the ERC20 specification and the identified issues are promptly confirmed and addressed. This document outlines our audit results.

1.1 About PolkaFantasy XP TOKEN

PolkaFantasy is the first-ever Japanese themed NFT game and marketplace. The native token, XP, is a utility token that is used throughout the PolkaFantasy ecosystem. Users can use XP in a number of usage scenarios under a variety of settings for the best user experience on PolkaFantasy games and NFT marketplace. The audited XP token contract aims to follow the ERC20 standard and this report examines its compliance and security. The basic information is as follows:

Table 1.1: Basic Information of PolkaFantasy XP TOKEN

Item	Description
Client	PolkaFantasy
Type	ERC20 Token Contract
Platform	Solidity
Audit Method	Whitebox
Audit Completion Date	August 31, 2021

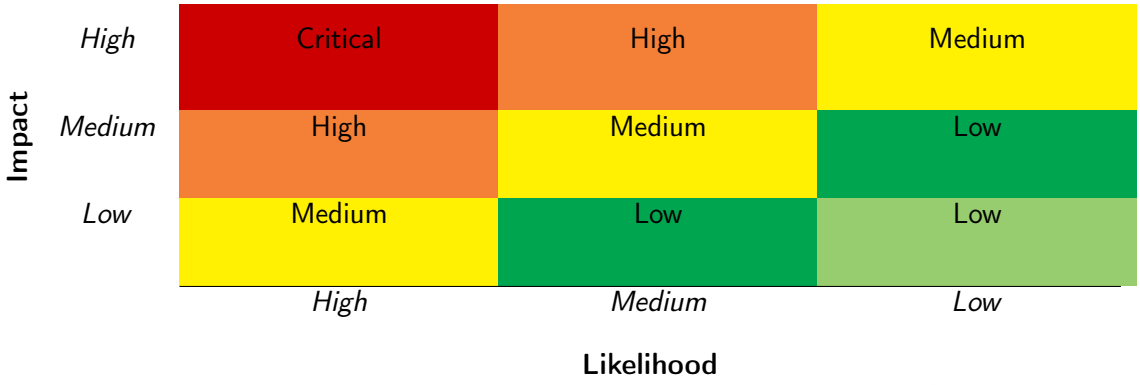
1.2 About PeckShield

PeckShield Inc. [6] is a leading blockchain security company with the goal of elevating the security, privacy, and usability of current blockchain ecosystems by offering top-notch, industry-leading services and products (including the service of smart contract auditing). We are reachable at Telegram (https://t.me/peckshield), Twitter (http://twitter.com/peckshield), or Email (contact@peckshield.com).

Table 1.2: Vulnerability Severity Classification



1.3 Methodology

To standardize the evaluation, we define the following terminology based on OWASP Risk Rating Methodology [5]:

- Likelihood represents how likely a particular vulnerability is to be uncovered and exploited in the wild;
- Impact measures the technical loss and business damage of a successful attack;
- Severity demonstrates the overall criticality of the risk;

Likelihood and impact are categorized into three ratings: *H*, *M* and *L*, i.e., *high*, *medium* and *low* respectively. Severity is determined by likelihood and impact and can be classified into four categories accordingly, i.e., *Critical*, *High*, *Medium*, *Low* shown in Table 1.2.

We perform the audit according to the following procedures:

- Basic Coding Bugs: We first statically analyze given smart contracts with our proprietary static code analyzer for known coding bugs, and then manually verify (reject or confirm) all the issues found by our tool.
- ERC20 Compliance Checks: We then manually check whether the implementation logic of the audited smart contract(s) follows the standard ERC20 specification and other best practices.
- Additional Recommendations: We also provide additional suggestions regarding the coding and development of smart contracts from the perspective of proven programming practices.

Table 1.3: The Full List of Check Items

Category	Check Item
Basic Coding Bugs	Constructor Mismatch
	Ownership Takeover
	Redundant Fallback Function
	Overflows & Underflows
	Reentrancy
	Money-Giving Bug
	Blackhole
	Unauthorized Self-Destruct
	Revert DoS
	Unchecked External Call
	Gasless Send
	Send Instead of Transfer
	Costly Loop
	(Unsafe) Use of Untrusted Libraries
	(Unsafe) Use of Predictable Variables
	Transaction Ordering Dependence
	Deprecated Uses
	Approve / TransferFrom Race Condition
ERC20 Compliance Checks	Compliance Checks (Section 3)
Additional Recommendations	Avoiding Use of Variadic Byte Array
	Using Fixed Compiler Version
	Making Visibility Level Explicit
	Making Type Inference Explicit
	Adhering To Function Declaration Strictly
	Following Other Best Practices

To evaluate the risk, we go through a list of check items and each would be labeled with a severity category. For one check item, if our tool does not identify any issue, the contract is considered safe

regarding the check item. For any discovered issue, we might further deploy contracts on our private testnet and run tests to confirm the findings. If necessary, we would additionally build a PoC to demonstrate the possibility of exploitation. The concrete list of check items is shown in Table 1.3.

1.4 Disclaimer

Note that this security audit is not designed to replace functional tests required before any software release, and does not give any warranties on finding all possible security issues of the given smart contract(s) or blockchain software, i.e., the evaluation result does not guarantee the nonexistence of any further findings of security issues. As one audit-based assessment cannot be considered comprehensive, we always recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contract(s). Last but not least, this security audit should not be used as investment advice.

2 | Findings

2.1 Summary

Here is a summary of our findings after analyzing the `PolkaFantasy XP` token contract. During the first phase of our audit, we study the smart contract source code and run our in-house static code analyzer through the codebase. The purpose here is to statically identify known coding bugs, and then manually verify (reject or confirm) issues reported by our tool. We further manually review business logics, examine system operations, and place ERC20-related aspects under scrutiny to uncover possible pitfalls and/or bugs.

Severity	# of Findings	
Critical	0	
High	0	
Medium	1	■
Low	1	■
Informational	0	
Total	2	

Moreover, we explicitly evaluate whether the given contracts follow the standard ERC20 specification and other known best practices, and validate its compatibility with other similar ERC20 tokens and current DeFi protocols. The detailed ERC20 compliance checks are reported in Section 3. After that, we examine a few identified issues of varying severities that need to be brought up and paid more attention to. (The findings are categorized in the above table.) Additional information can be found in the next subsection, and the detailed discussions are in Section 4.

2.2 Key Findings

Overall, no ERC20 compliance issue was found and our detailed checklist can be found in Section 3. The smart contract implementation is improved by addressing the identified issues, including 1 medium-severity vulnerability and 1 low-severity issue.

Table 2.1: Key PolkaFantasy XP TOKEN Audit Findings

ID	Severity	Title	Category	Status
PVE-001	Low	Possible Decimal Inconsistency	Business Logic	Fixed
PVE-002	Medium	Trust Issue Of Admin Roles	Security Features	Confirmed

Besides recommending specific countermeasures to mitigate these issues, we also emphasize that it is always important to develop necessary risk-control mechanisms and make contingency plans, which may need to be exercised before the mainnet deployment. The risk-control mechanisms need to kick in at the very moment when the contracts are being deployed in mainnet. Please refer to Section 3 for our detailed compliance checks and Section 4 for elaboration of reported issues.

3 | ERC20 Compliance Checks

The ERC20 specification defines a list of API functions (and relevant events) that each token contract is expected to implement (and emit). The failure to meet these requirements means the token contract cannot be considered to be ERC20-compliant. Naturally, as the first step of our audit, we examine the list of API functions defined by the ERC20 specification and validate whether there exist any inconsistency or incompatibility in the implementation or the inherent business logic of the audited contract(s).

Table 3.1: Basic `View-Only` Functions Defined in The ERC20 Specification

Item	Description	Status
name()	Is declared as a public view function	✓
	Returns a string, for example "Tether USD"	✓
symbol()	Is declared as a public view function	✓
	Returns the symbol by which the token contract should be known, for example "USDT". It is usually 3 or 4 characters in length	✓
decimals()	Is declared as a public view function	✓
	Returns decimals, which refers to how divisible a token can be, from 0 (not at all divisible) to 18 (pretty much continuous) and even higher if required	✓
totalSupply()	Is declared as a public view function	✓
	Returns the number of total supplied tokens, including the total minted tokens (minus the total burned tokens) ever since the deployment	✓
balanceOf()	Is declared as a public view function	✓
	Anyone can query any address' balance, as all data on the blockchain is public	✓
allowance()	Is declared as a public view function	✓
	Returns the amount which the spender is still allowed to withdraw from the owner	✓

Our analysis shows that there is no ERC20 inconsistency or incompatibility issue found in the audited `PolkaFantasy XP` token contract. In the surrounding two tables, we outline the respective list of basic `view-only` functions (Table 3.1) and key `state-changing` functions (Table 3.2) according to

the widely-adopted ERC20 specification.

Table 3.2: Key `State-Changing` Functions Defined in The ERC20 Specification

Item	Description	Status
transfer()	Is declared as a public function	✓
	Returns a boolean value which accurately reflects the token transfer status	✓
	Reverts if the caller does not have enough tokens to spend	✓
	Allows zero amount transfers	✓
	Emits Transfer() event when tokens are transferred successfully (include 0 amount transfers)	✓
	Reverts while transferring to zero address	✓
transferFrom()	Is declared as a public function	✓
	Returns a boolean value which accurately reflects the token transfer status	✓
	Reverts if the spender does not have enough token allowances to spend	✓
	Updates the spender's token allowances when tokens are transferred successfully	✓
	Reverts if the from address does not have enough tokens to spend	✓
	Allows zero amount transfers	✓
	Emits Transfer() event when tokens are transferred successfully (include 0 amount transfers)	✓
	Reverts while transferring from zero address	✓
	Reverts while transferring to zero address	✓
approve()	Is declared as a public function	✓
	Returns a boolean value which accurately reflects the token approval status	✓
	Emits Approval() event when tokens are approved successfully	✓
	Reverts while approving to zero address	✓
Transfer() event	Is emitted when tokens are transferred, including zero value transfers	✓
	Is emitted with the from address set to $address(0x0)$ when new tokens are generated	✓
Approval() event	Is emitted on any successful call to approve()	✓

In addition, we perform a further examination on certain features that are permitted by the ERC20 specification or even further extended in follow-up refinements and enhancements, but not required for implementation. These features are generally helpful, but may also impact or bring certain incompatibility with current DeFi protocols. Therefore, we consider it is important to highlight them as well. This list is shown in Table 3.3.

Table 3.3: Additional Opt-in Features Examined in Our Audit

Feature	Description	Opt-in
Deflationary	Part of the tokens are burned or transferred as fee while on transfer()/transferFrom() calls	—
Rebasing	The balanceOf() function returns a re-based balance instead of the actual stored amount of tokens owned by the specific address	—
Pausable	The token contract allows the owner or privileged users to pause the token transfers and other operations	✓
Blacklistable	The token contract allows the owner or privileged users to blacklist a specific address such that token transfers and other operations related to that address are prohibited	—
Mintable	The token contract allows the owner or privileged users to mint tokens to a specific address	✓
Burnable	The token contract allows the owner or privileged users to burn tokens of a specific address	✓

4 Detailed Results

4.1 Possible Decimal Inconsistency

- ID: PVE-001
- Severity: Low
- Likelihood: Low
- Impact: Low
- Target: `erc20Token`
- Category: Business Logic [4]
- CWE subcategory: CWE-837 [2]

Description

Though there is a standardized ERC20 specification, many token contracts may not strictly follow the specification or have additional functionalities beyond the specification. In the following, we examine the specific functionality regarding the decimal used in the `PolkaFantasy XP` token contract.

In particular, we show below the related `constructor()` function of the `erc20Token` contract. This contract inherits from the parent `ERC20` contract for the basic ERC20-related functionality, including `transfer()`, `transferFrom()`, and `allow()`. However, unless explicitly specified, the parent `ERC20` contract assumes the default decimal of `18`, which may not be equal to the given `decimals` argument.

```
1388    constructor(string memory name, string memory symbol, address account, uint256 cap,
            uint8 decimals) public ERC20(name, symbol) ERC20Capped(cap * (10**uint256(
            decimals))) {
1389        _setupRole(DEFAULT_ADMIN_ROLE, msg.sender);
1390
1391        _setupRole(MINTER_ROLE, account);
1392        _setupRole(PAUSER_ROLE, account);
1393    }
```

Listing 4.1: erc20Token::**constructor**()

Recommendation For consistency, there is a need to explicitly call `_setupDecimals(decimals)` so that the input decimal becomes effective. An example revision is shown below:

```
1388    constructor(string memory name, string memory symbol, address account, uint256 cap,
            uint8 decimals) public ERC20(name, symbol) ERC20Capped(cap * (10**uint256(
            decimals))) {
1389        _setupRole(DEFAULT_ADMIN_ROLE, msg.sender);
1390
1391        _setupRole(MINTER_ROLE, account);
1392        _setupRole(PAUSER_ROLE, account);
1393        _setupDecimals(decimals);
1394    }
```

Listing 4.2: Revised erc20Token::**constructor**()

Status This issue has been fixed by invoking `_setupDecimals(decimals)` in the `erc20Token::constructor()` routine.

4.2 Trust Issue Of Admin Roles

- ID: PVE-002
- Severity: Medium
- Likelihood: Low
- Impact: High
- Target: `erc20Token`
- Category: Security Features [3]
- CWE subcategory: CWE-287 [1]

Description

In the `PolkaFantasy XP` token contract, there is a privileged `admin` account that plays a critical role in governing and regulating the entire operation and maintenance (e.g., assignment of other roles to mint or burn). It also has the privilege to pause the current token contract for transfers.

```
1395    /**
1396     * @dev Creates ‘amount‘ new tokens for ‘to‘.
1397     *
1398     * Requirements:
1399     *
1400     * - the caller must have the ‘MINTER_ROLE‘.
1401     */
1402    function mint(address to, uint256 amount) public virtual {
1403        require(hasRole(MINTER_ROLE, _msgSender()), "MyToken: must have minter role to
                mint");
1404        _mint(to, amount);
1405    }
1406
1407    /**
1408     * @dev Pauses all token transfers.
1409     *
1410     * Requirements:
1411     *
```

```
1412      * - the caller must have the 'PAUSER_ROLE'.
1413      */
1414     function pause() public virtual {
1415         require(hasRole(PAUSER_ROLE, _msgSender()), "MyToken: must have pauser role to
              pause");
1416         _pause();
1417     }
```

Listing 4.3: erc20Token::mint()/pause()

To elaborate, we show above a privileged `mint()` function. This function allows for the authorized account to mint more tokens into circulation (while being capped). We understand the need of the privileged functions for contract operation and maintenance, but at the same time the extra power to the owner may also be a counter-party risk to the contract users. Therefore, we list this concern as an issue here from the audit perspective and highly recommend making these privileges explicit or raising necessary awareness among contract users.

Recommendation Make the list of extra privileges granted to `admin` explicit to `PolkaFantasy XP` users.

Status This issue has been confirmed.

5 | Conclusion

In this security audit, we have examined the design and implementation of the `PolkaFantasy XP` token contract. During our audit, we first checked all respects related to the compatibility of the ERC20 specification and other known ERC20 pitfalls/vulnerabilities. We then proceeded to examine other areas such as coding practices and business logics. Overall, although no critical vulnerabilities were discovered, we identified two issues of varying severities that were promptly confirmed and addressed by the team. In the meantime, as disclaimed in Section 1.4, we appreciate any constructive feedbacks or suggestions about our findings, procedures, audit scope, etc.
